## The PRIDE database – Public data reuse: Bringing proteomics data to biologists

- EMBL-EBI's PRIDE database is the largest data resource of MS proteomics data worldwide.
- During 2021 alone, 490 datasets were submitted per month on average to PRIDE.
- Reuse of public proteomics datasets is increasing dramatically, with multiple applications.
- Rather than in the creation of new bioinformatic resources, for sustainability reasons, our focus is to disseminate and integrate PRIDE proteomics data into added-value EMBL-EBI resources, namely **UniProt** (PTM data, protein sequences), **Expression Atlas** (protein expression information, the focus of this poster), **Ensembl** (proteogenomics data) and **MGNify** (metaproteomics and metagenomics data).
- The goal is to make proteomics data more accessible to life science scientists, especially those non-expert in proteomics.

## Internal reanalysis of dataset using quantms (DDA-LFQ, DDA-TMT, DIA)

### Major Data-related features:

- Use multiple search engines in combination (msgf+, comet), boost the number of peptides by using percolator.
- Perform multiple protein quantification methods: LFQ-intensity based, spectral counting, TMT intensity, DIA-LFQ intensity based.
- False localization rate analysis for PTMs including Phosphorylation and acetylation.
- Based on HUPO-PSI standard file formats including mzTab, mzML, SDRF.

### Major cloud features:

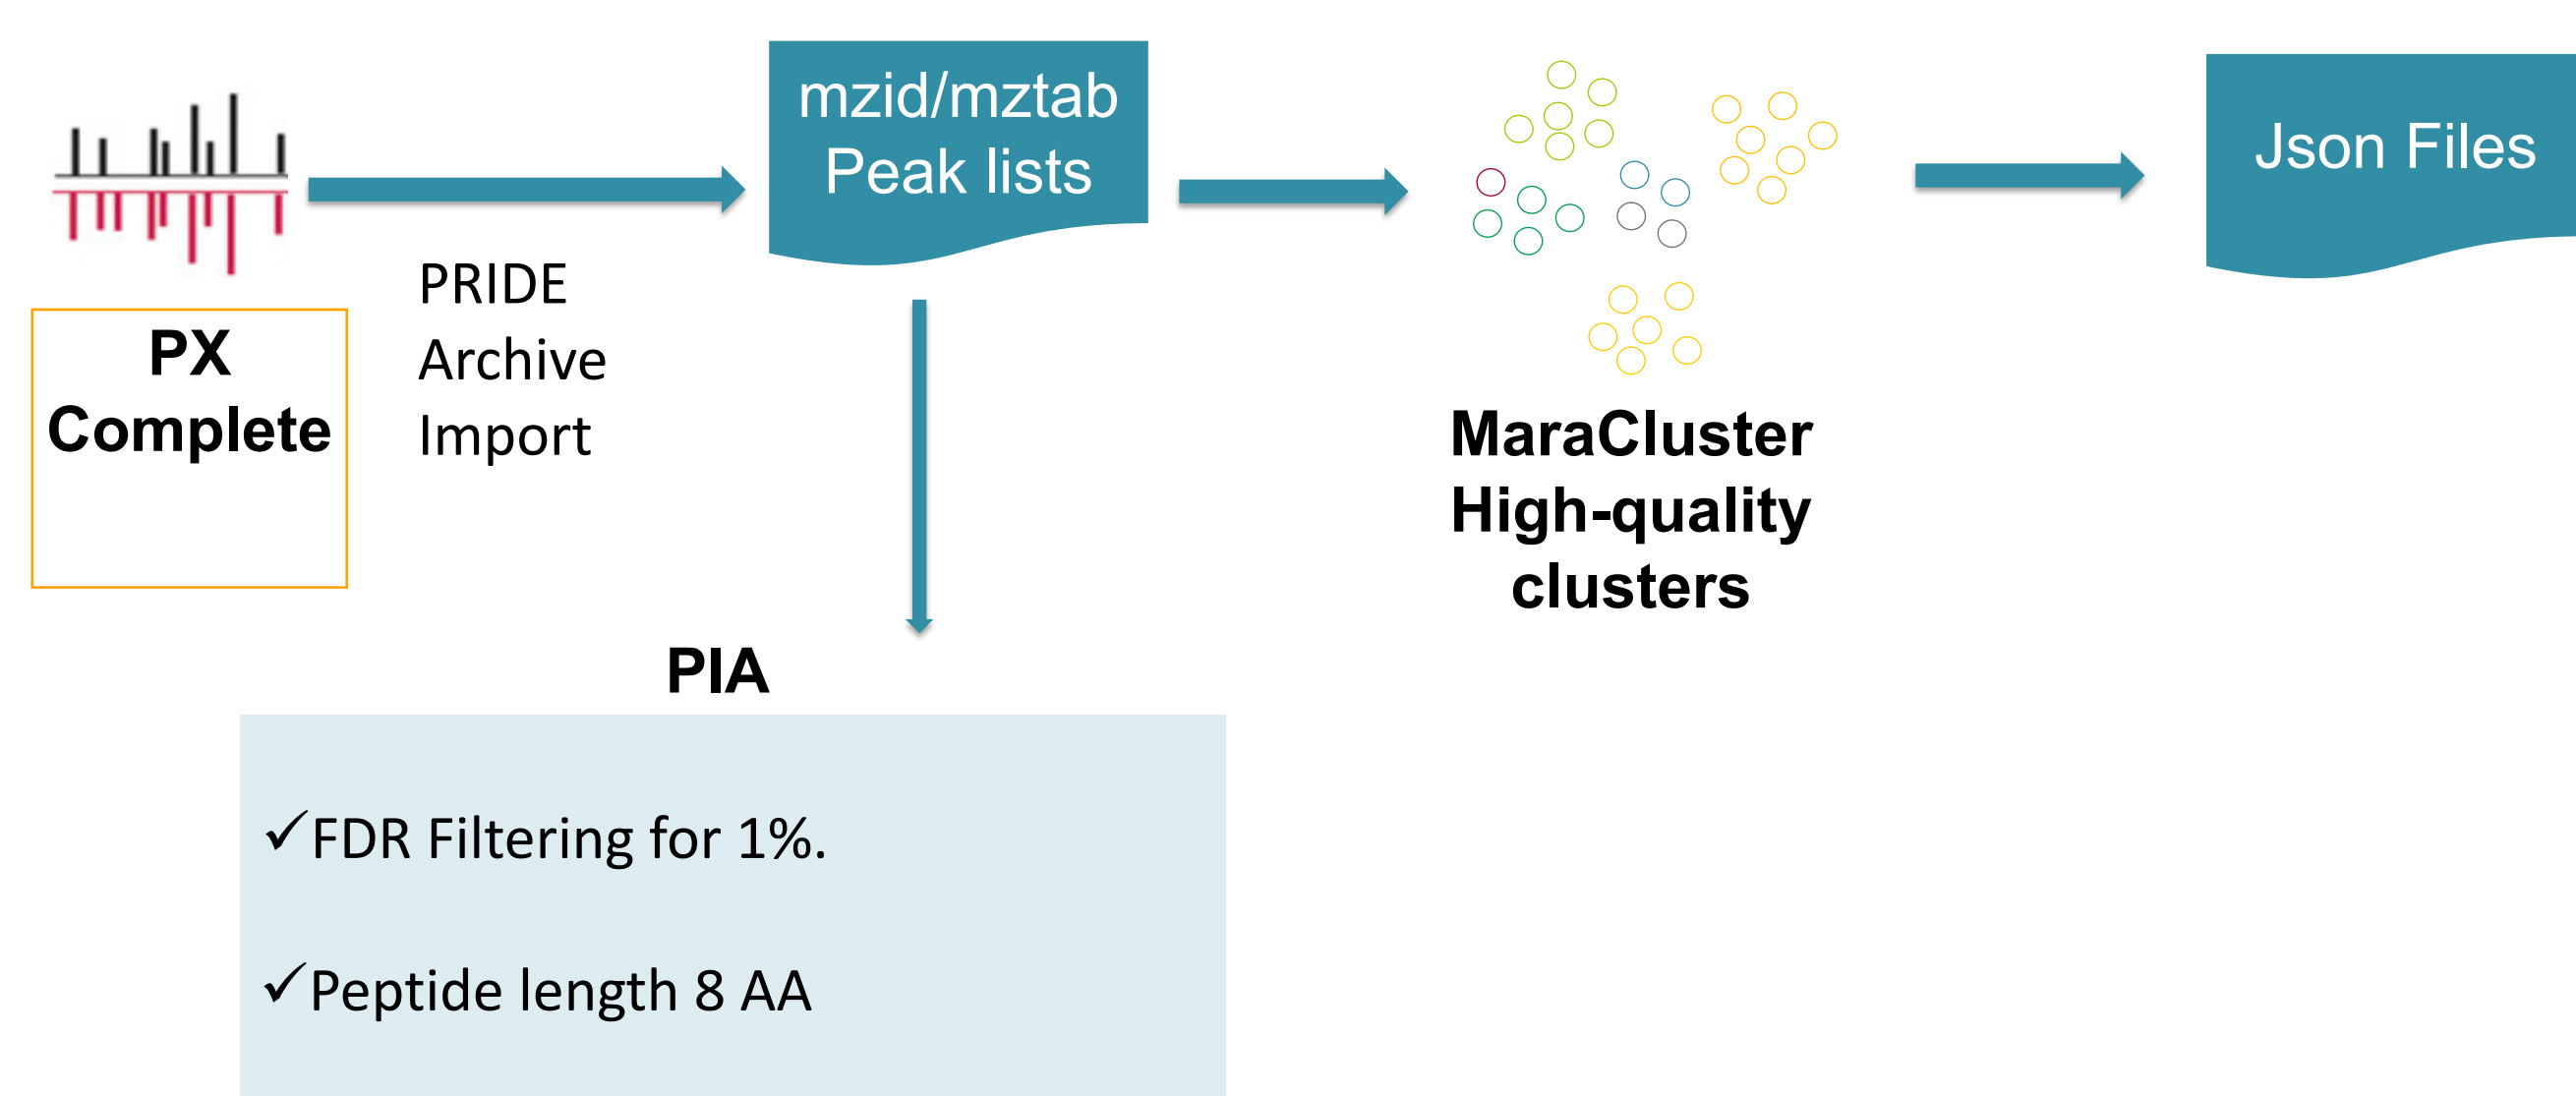

- Can be executed in LSF, AWS, Google Cloud, Kubernetes, local PC, HPC. Based on BioContainers.
- Open-source, open access.
- Include features for compute resource allocation, automatic fail-tolerance and resume workflows.

## From complete submissions to peptide evidences

- ✓ 1294 Projects
- ✓ 217'261 Proteins
- ✓ 2'300'389 Peptides
- ✓ 1'922'855 Unique Peptides
- ✓ 150'658'201 PSMs

## Peptidome and spectra archive

- ✓ Search by peptides, protein accessions, names, gene names.
- ✓ Peptide + protein visualization including names, number of psm and projects.
- ✓ ENSEMBL and Uniprot links to the corresponding spectra that validate a specific sequence feature (e.g., PTM or variant)
